It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to zsig9 are useful for detecting and treating tumours. The antagonist may be an antibody or receptor to zsig9 and it may be radio-labelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding zsig9. The zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting and treating cancers, especially of the brain, liver, stomach, lymphoma etc., at an early stage.

                   This sequence represents the coding sequence of human cDNA clone H910390 which encodes a 20 kD protein with one putative transmembrane domain in the N-terminus. The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transforme with these nucleotides may be used to screen for agonists and antagonist which are potentially useful therapeutically.
                                                                                                                                                                           Claim

CC AAA43426 to AAA45925 represent specifically claimed secreted expressed CC sequence tags (SESTs), isolated from human, mouse, chicken and rat CC tissue sources. The SESTs can have a range of activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; haematopoietic; chemotactic; analgesic; haemostatic; intrombolytic; antiinflammatory; CC chemokinetic; analgesic; haemostatic; intrombolytic; antiinflammatory; CC control; vulnerary; antiulcer; osteopathic; neuroprotective; CC antiasthmatic; vulnerary; antiulcer; osteopathic; neuroprotective; CC anticonvulsant; and antidepressant. The sESTs can be used for gene CC identification and isolation of full-length cDNAs and genomic DNA CC molecules which correspond to the SESTs, proteins encoded by the sESTs are useful as probes for the CC identification and isolation of full-length cDNAs and genomic DNA CC molecules which correspond to the SESTs, proteins encoded by the sESTs are useful as probes for the CC identification and isolation of full-length cDNAs and genomic DNA CC (multiple sclerosis, insulin dependent diabetes), allergic conditions CC (multiple sclerosis, insulin dependent diabetes), allergic conditions CC (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (Crohn's Cdisease), tumours, bacterial, fungal or viral infections, dependent of automoros, bacterial, fungal or viral infections, dependent and correctors, dependent of appression and correctors. Secured to AAA45931 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Jacobs K,
